

Smarter Systems, Lower Operating Costs

BUILDING DECARBONIZATION PROGRAM

Atlantic City Electric's **Building Decarbonization** program helps businesses attract and retain tenants, comply with evolving regulations, and enhance community well-being.

This program offers financial incentives to make decarbonization projects more affordable for businesses of all sizes. By switching from fossil fuels to cleaner electric systems, businesses can reduce carbon pollution from heating and cooling. Incentives cover the installation of high-efficiency equipment, modern electric appliances, and necessary infrastructure upgrades—like panel replacements to help lower greenhouse gas emissions and cut costs.

Program Eligibility

To qualify, your project(s) must include the following:

- Replacing fossil fueled systems (gas furnace, oil boiler, gas water heater, etc.)
- Documenting existing conditions (manufacturer, model number, product efficiency, age, photos, spec sheets, if available)
- Integrating controls if fossil fueled backup systems are retained

Buildings contribute nearly
**40% of global greenhouse
gas (GHG) emissions.** Without
major changes,
this could double
by 2050.*

A custom program is available from Atlantic City Electric for customers with complex energy needs not fully met by the Building Decarbonization program. Additional requirements apply.
